Joint 10th Working IEEE/IFIP Conference on Software Architecture & 6th European Conference on Software Architecture

WORKLOAD-AWARE SYSTEM MONITORING USING PERFORMANCE PREDICTIONS APPLIED TO A LARGE-SCALE E-MAIL SYSTEM

Christoph Rathfelder (rathfelder@fzi.de) FZI Research Center for Information Technology Karlsruhe, Germany

Stefan Becker (stefan.becker@1und1.de)

1&1 Internet AG, Germany

Klaus Krogmann (krogmann@fzi.de)

FZI Research Center for Information Technology Karlsruhe, Germany

Ralf Reussner (reussner@kit.edu) Karlsruhe Institute of Technology, Germany

Agenda

- 1. Quick Facts about the 1&1 Mail System
- 2. Motivation and Approach
- 3. Foundation
 - 1. Model-based Performance Predictions
 - 2. Palladio Approach
- 4. Case Study
- 5. Validation and Applicability of our Approach
- 6. Lessons Learned
- 7. Conclusion and Future Work

The 1&1 Mail System

Quick Facts

> 200 Million emails per day

Build up as service oriented system
More than 100 software services
Distributed over 2,000 hosts

Chris Rathfelder, Stefan Becker : Workload-aware System Monitoring Using Performance Predictions Applied to a Large-scale E-Mail System © 2012 1&1 Internet AG and FZI Forschungszentrum Informatik

Motivation

- Ensuring high availability with guaranteed quality of service
 Detailed monitoring of the system
 - Potential reasons for deviating resource utilisation
 - Misbehaving loadbalancer
 Hardware failures
 Service unavailability
 Connection problems
 - Identified reason was

Chris Rathfelder, Stefan Becker : Workload-aware System Monitoring Using Performance Predictions Applied to a Large-scale E-Mail System

Motivation

Ensuring high availability with guaranteed quality of service
 Detailed monitoring of the system

Chris Rathfelder, Stefan Becker : Workload-aware System Monitoring Using Performance Predictions Applied to a Large-scale E-Mail System

Approach

Applying performance prediction to derive the expected system behaviour depending on the monitored user behaviour

Chris Rathfelder, Stefan Becker : Workload-aware System Monitoring Using Performance Predictions Applied to a Large-scale E-Mail System

Approach

Applying performance prediction to derive the expected system behaviour depending on the monitored user behaviour

Validation

Predicition Accuracy

- Comparison between real and predicted utilisations per resource
 - 1 reference day
 - 48 Measurements30 minutes each
 - Over all mean error 8,6 %

	CPU	NET in	NET out	DISK
Whole Model				
Average	12,94	5,99	5,92	9,64
Decile	36,7	13,46	12,37	20,1
PROXY-Server				
Average	5,9	2,93	5,92	
Decile	10,1	6,4	11,09	
STORE-Server				
Average	15,29	7,01	6,01	9,64
Decile	42,1	16, 19	13,31	20,1

Model errors in percent

Chris Rathfelder, Stefan Becker : Workload-aware System Monitoring Using Performance Predictions Applied to a Large-scale E-Mail System

Applicability of our Approach

Simulated System Failure

Real and predicted resource utilisation over the day

Planned update between 2:00 p.m. and 6:00 p.m.

Situation for the model to raise an alarm

Chris Rathfelder, Stefan Becker : Workload-aware System Monitoring Using Performance Predictions Applied to a Large-scale E-Mail System © 2012 1&1 Internet AG and FZI Forschungszentrum Informatik

Lessons Learned

Distributed knowledge and outdated documentation increase efforts
 Performance models can serve as documentation

Very large systems can not be meassured out by performing experiments
 High availability => too dangerous
 Creating the needed load needs many resources
 Existing logfiles often contain useful data

Redundant parts can be depicted together in a model
 Combining servers with identical hardware software and load

Detection of missconfigurations

Possible already in early steps of the modelling process

I.E. we found a server with disabled hyperthreading.

Conclusions and Outlook

Conclusions

- Enhancing a system monitoring process with performance prediction results
- Applicability of PCM in an industrial environment shown (mean model error of 8,6 %)

Future Work

- Improved support for replicated software components
- Automated model extraction and calibration
- Runtime management based on performance predictions
